

Your mobile is full of stuff

A modern cell phone is made up of lots and lots of individual parts. No wonder, it is of course a camera, computer, data storage, music player and much more in a single device.

Oh, and you can make telephone calls with it too!

1.

Touch screen

The screen's surface, which reacts to touch, is called a touchscreen. But it doesn't actually react to touch at all, rather it reacts to electrical changes that occur when you touch it with your finger.

2.

Camera

Every smartphone has a camera for taking pictures and videos. Quite often they also come with a second one in front so that you can take selfies easier.

3.

Display

The LCD screen is the screen of the smartphone. Teeny-tiny crystals in the display makes sure that you can see images, text and colors.

4.

Processor

The processor is the cell phone's brain, so to speak.

5.

USB cable

The USB cable has two functions: It can be used to charge the battery or it can be used to connect the phone to a computer to transfer data from one device to another.

SIDE TIP

There are three different types of SIM cards. You should always make sure that your card is the kind that fits in your phone!

mini-SIM

micro-SIM

nano-SIM
